

NAME

getpat -- get pattern

SYNOPSIS

```
jsr r5,getpat;pname;buffer;otype
```

DESCRIPTION

Returns 1 in r0 for successful read, zero otherwise
Returns new buffer pointer in r1 (even location)

This subroutine is designed to read in patterns written on disk by the RC:PAT command. It attempts to open the file PNAME.P. If this fails it attempts to open the file /typexx/pname, where xx = otype(2chars). If this fails, the directory, /compat is searched. if all of the above fail, the directory /usr/pat is searched. if all four searches fail, the pattern is not to be found.

RESTRICTIONS

This command will not exist beyond SC5.

LIBRARY

/lib/lib1.a
